

The first team meeting was mainly focused on brainstorming ideas and understanding the design thinking process. Our team discussed different domains where technology and data could help solve real-world problems.

We explored the possibility of using wearable devices and monitoring systems in different professional fields. The discussion helped us understand that many professions face problems related to physical strain that often goes unnoticed until it becomes serious.

Due to exams we did not make significant progress after the meeting, but we exchanged a few ideas through messages & planned to explore them further once exams were completed.
